Asset Return

Dr. Rachida Ouysse

School of Economics UNSW

Introduction

Preliminaries

Financial time series (FTS) analysis is concerned with theory and practice of asset valuation over time.

Comparison with other Time Series analysis: similarity and difference? Highly related, but with some added uncertainty, because FTS must deal with the ever-changing business & economic environment and the fact that volatility is not directly observed. Objective of the course

- to learn ways to get financial information from web directly and to process the information.
- to provide some basic knowledge of financial time series data such as skewness, heavy tails, and measure of dependence between asset returns
- to introduce some statistical tools & econometric models useful for analyzing these series.

Examples of kind of problems you can solve

- Testing whether financial markets are weak-form informationally efficient.
- Testing whether the CAPM or APT represent superior models for the determination of returns on risky assets.
- Measuring and forecasting the volatility of bond returns.
- Explaining the determinants of bond credit ratings used by the ratings agencies.
- Modelling long-term relationships between prices and exchange rates
- Testing technical trading rules to determine which makes the most money.
- Testing the hypothesis that earnings or dividend announcements have no effect on stock prices.
- Testing whether spot or futures markets react more rapidly to news.
- Forecasting the correlation between the returns to the stock indices of two countries.

What are special characteristics of Financial Data?

Frequency & quantity of data

 Stock market prices are measured every time there is a trade or somebody posts a new quote.

Quality

Preliminaries

0000000

 Recorded asset prices are usually those at which the transaction took place. No possibility for measurement error but financial data are noisy.

0000000

Examples of financial time series

1. Daily log returns of Apple stock: 2004 to 2013 (10 years)

- 1. Daily log feturns of Apple stock: 2004 to 2015 (10 years
- $2.\ {\rm The\ VIX\ index}$
- CDS spreads: Daily 3-year CDS spreads of JP Morgan from July 20, 2004 to September 19, 2014.
- Quarterly earnings of Coca-Cola Company: 1983-2009
 Seasonal time series useful in
 - · earning forecasts
 - · pricing weather related derivatives (e.g. energy)
 - · modeling intraday behavior of asset returns
- US monthly interest rates (3m & 6m Treasury bills)
 Relations between the two series? Term structure of interest rates
- Exchange rate between US Dollar vs Euro Fixed income, hedging, carry trade
- 7. Size of insurance claims

Values of fire insurance claims ($\times 1000$ Krone) that exceeded 500 from 1972 to 1992.

High-frequency financial data:
 Tick-by-tick data of Caterpillars stock: January 04, 2010.

0000000

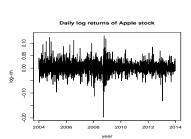

Figure 1: Daily log returns of Apple stock from 2004 to 2013

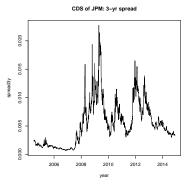

Figure 3: Time plot of daily 3-year CDS spreads of JPM: from July 20, 2004 to September 19, 2014.

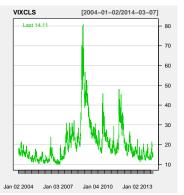

Figure 4: CBOE Vix index: January 2, 2004 to March 7, 2014.

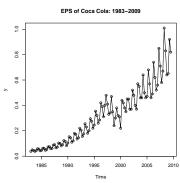

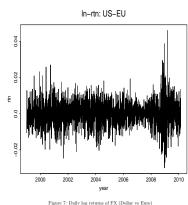

Figure 5: Quarterly earnings per share of Coca-Cola Company

000000

Figure 6: Daily Exchange Rate: Dollars per Euro

What is a stock?

A stock (also known as equity) is a security that represents the ownership of a fraction of a corporation. This entitles the owner of the stock to a proportion of the corporation's assets and profits equal to how much stock they own. Units of stock are called shares.

- Stocks are bought and sold predominantly on stock exchanges, though there can be private sales as well, and they are the foundation of nearly every portfolio.
- Historically, they have outperformed most other investments over the long run.

What is a financial asset?

Financial assets represent investments in the assets and securities of other institutions. Financial assets include stocks, sovereign and corporate bonds, preferred equity, and other hybrid securities. Financial assets are valued depending on how the investment is categorized and the motive behind it.

What Is Equity?

Equity, typically referred to as shareholders' equity (or owners' equity for privately held companies), represents the amount of money that would be returned to a company's shareholders if all of the assets were liquidated and all of the company's debt was paid off in the case of liquidation. In the case of acquisition, it is the value of company sales minus any liabilities owed by the company not transferred with the sale.

What Is Earnings Per Share (EPS)?

Earnings per share (EPS) is calculated as a company's profit divided by the outstanding shares of its common stock. The resulting number serves as an indicator of a company's profitability. It is common for a company to report EPS that is adjusted for extraordinary items and potential share dilution. The higher a company's EPS, the more profitable it is considered to be.

Asset Returns: Definition

Let P_t be the price of an asset at time t, and assume no dividend.

One-period simple return:

Gross return

$$1 + R_t = \frac{P_t}{P_{t-1}}$$

$$P_t = P_{t-1}(1 + R_t)$$

Simple return:

$$R_t = \frac{P_t - P_{t-1}}{P_{t-1}} = \frac{P_t}{P_{t-1}} - 1$$

Multiperiod simple return

$$1 + R_t(k) = \frac{P_t}{P_{t-k}}$$

$$= (1 + R_t)(1 + R_{t-1}) \cdots (1 + R_{t-k+1})$$

$$= \Pi_{j=0}^{k-1} (1 + R_{t-j})$$

Table below gives five daily closing prices of Apple stock in December 2011.

Date	12/02	12/05	12/06	12/07	12/08	12/09
Price(\$)	389.70	393.01	390.95	389.09	390.66	393.62

- The 1-day **simple** return of holding the stock from 12/8 to 12/9: 0.76%
- The 3-day **simple** return for holding the stock from 12/02 to 12/07: -0.15%
- The 5-day simple return for holding the stock from 12/02 to 12/09:
 Answer?

Asset Return

000000000

Annulalized Asset Returns

Time interval is important! Default is one year.

Annualized (average) return:

Annualized
$$[R_t(k)] = \left[\prod_{j=0}^{k-1} (1 + R_{t-j}) \right]^{1/k} - 1.$$

An approximation:

Annualized
$$[R_t(k)] \approx \frac{1}{k} \sum_{j=0}^{k-1} R_{t-j}$$
.

Continuously compounding: Illustration of the power of compounding (int. rate 10% per annum)

Type	#(payment)	Int.	Net
Annual	1	0.1	\$1.10000
Semi-Annual	2	0.05	\$1.10250
Quarterly	4	0.025	\$1.10381
Monthly	12	0.0083	\$1.10471
Weekly	52	0.1 52	\$1.10506
Daily	365	0.1 52 0.1 365	\$1.10516
Continuously	∞		\$1.10517

$$A = C \exp[r \times n]$$

where r is the interest rate per annum, C is the initial capital, n is the number of years, and exp is the exponential function.

Present value:

$$C = A \exp[-r \times n]$$

Asset Return

0000000000

Continuously compounded (or log) return

$$r_t = \ln(1 + R_t) = \ln \frac{P_t}{P_{t-1}} = p_t - p_{t-1},$$

where $p_t = \ln(P_t)$.

Multiperiod log return:

$$r_t(k) = \ln[1 + R_t(k)]$$

$$= \ln[(1 + R_t)(1 + R_{t-1}) \cdots (1 + R_{t-k+1})]$$

$$= \ln(1 + R_t) + \ln(1 + R_{t-1}) + \cdots + \ln(1 + R_{t-k+1})$$

$$= r_t + r_{t-1} + \cdots + r_{t-k+1}.$$

Annulalized Asset Returns

Example Consider again the Apple stock price.

What is the log return from 12/8 to 12/9?

A:

Preliminaries

7.5%

What is the log return from day 12/2 to 12/9?

Asset Return

A:

1%

What is the log return from day 12/6 to 12/8?

A:

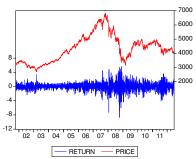

Market Index and Return

- Market index: $P_{m,t} = \sum_{i=1}^{N} w_{it} P_{i,t}, t = 1, 2, \cdots$ weight w_{it} depends on outstanding shares of stock i, etc
- Log return:

$$r_{m,t} = 100\% \times \ln\left(\frac{P_{m,t}}{P_{m,t-1}}\right)$$

eg. S&P/ASX200 Index and Return

DATE	ADJCLOS	RETURN
2001-10-17	3237.9	NA
2001-10-18	3199.6	-1.189917
2001-10-19	3175.4	-0.759219
2001-10-23	3213.3	1.186484
2001-10-24	3246.0	1.012502
2001-10-25	3254.7	0.267664
2001-10-26	3276.2	0.658411
2001-10-29	3256.2	-0.612334
2001-10-30	3252.8	-0.104471
2001-10-31	3249.6	-0.098425
2001-11-01	3248.8	-0.024621
2001-11-02	3239.9	-0.274323
2001-11-05	3225.8	-0.436148
2001-11-06	3285.1	1.821611
2001-11-07	3252.6	-0.994242
2001-11-08	3269.4	0.515181
2001-11-09	3286.0	0.506454

An investor holds stocks of IBM, Microsoft and Citi- Group. Assume that her capital allocation is 30%, 30% and 40%. What is the mean simple return of her stock portfolio?

Assume monthly simple returns for IBM, microsoft and Citi-Group, 1.35%, 2.62% and 1.17% respectively.

Answer:

• Portfolio Return: $R_{p,t} = \sum_{i=1}^N w_{it} R_{i,t}, \ t=1,2,\cdots$, where N is the number of assets held by investor and w_{it} is wealth allocation.

1 Adjusting for dividends (Total Returns)

$$r_t = \ln(1 + R_t) = \ln\left(\frac{P_t + D_t}{P_{t-1}}\right)$$
$$= \ln(P_t + D_t) - \ln(P_{t-1})$$

Asset Return

000000000

Adjusting for inflation (Real Returns)

$$r_t^{Real} = \ln\left(1 + R_t^{Real}\right) = \ln\left(\frac{P_t}{P_{t-1}}\frac{CPI_{t-1}}{CPI_t}\right)$$

Adjusting for Risk (Excess Returns)

$$Z_t = R_t - R_{ft}$$

$$z_t = \ln(Z_t) = \ln(R_t - R_{ft}) \neq r_t - r_{ft}$$

BUT if Z_t is small: $z_t \approx r_t - r_{ft}$

Dividends, Excess returns

Relationship:

$$r_t = \ln(1 + R_t), \quad R_t = e^{r_t} - 1.$$

If the returns are in **percentage**, then

$$r_t = 100 \times \ln(1 + \frac{R_t}{100}), \quad R_t = [\exp(r_t/100) - 1] \times 100.$$

Temporal aggregation of the returns produces

$$1 + R_t(k) = (1 + R_t)(1 + R_{t-1}) \cdots (1 + R_{t-k+1}),$$

$$r_t(k) = r_t + r_{t-1} + \cdots + r_{t-k+1}.$$

These two relations are important in practice, e.g. obtain annual returns from monthly returns.

If the monthly log returns of an asset are 4.46% , -7.34% and 10.77% , then

- what is the corresponding quarterly log return?
- 2 what is the corresponding quarterly simple return?

Answer

- (1) Quarterly log return:
- (2) Quarterly simple return:

How to inverst \$100?
